

GUNJAN VASARA

Senior Frontend Engineer | React · TypeScript · Next.js | 7+ Years | Immediate Joiner

gunjan.gojiya@gmail.com • [linkedin.com/in/gunjan-vasara-667170175](https://www.linkedin.com/in/gunjan-vasara-667170175) • github.com/Goonjan • gunjanvasara.dev

SUMMARY

Senior Frontend Engineer with 7+ years building and owning complex, user-facing systems end-to-end — from React/TypeScript/Next.js architecture through UI/UX polish to production delivery. Known for spotting inconsistencies others miss, driving them to resolution, and stepping into backend and API work when it unblocks delivery. Strong design intuition, with experience leading small teams and conducting technical interviews. Fully remote for 4+ years; open to remote opportunities worldwide.

SKILLS

Core Strengths: Ownership & End-to-End Delivery · UI/UX Judgment · Problem Solving · Cross-Functional Collaboration · Team Leadership · Requirement Gathering · Design Thinking

Frontend: React, Next.js, TypeScript, JavaScript (ES6+), Tailwind CSS, Material UI (MUI), ReactFlow, Lottie Animations

State Management: Redux, Zustand, Context API

Data & Visualization: Analytical charts (line, bar, area, pie), graph-based systems, telemetry dashboards

Backend / API: GraphQL (Apollo Client), REST APIs, Node.js basics

Testing & Quality: Jest (unit & integration), Playwright (E2E), performance profiling

Tools & Practices: Git, CI/CD, Vercel, Render, Asana

AI Tools: Claude, ChatGPT, Gemini, Google Stitch, Figma Make

EXPERIENCE

Deuex Solutions Pvt Ltd

Senior Software Engineer · Remote · Jun 2021 – Present

12thMen — Sports Team & Tournament Platform

Jul 2026 – Present · React, TypeScript, Next.js 15

- Leading the UI/UX architecture and product strategy for a high-frequency sports platform, building real-time auction workflows and tournament management systems.
- Audited end-to-end user flows across team creation, competitive bidding, and tournament setup to remove onboarding friction and improve conversions.

Highflame — Enterprise LLM Security Platform (Client)

Jun 2025 – Jul 2026 · React, TypeScript, Next.js 15, Vitest, TanStack Query v5, RHF, Zod, Tailwind, Clerk, PostHog, Playwright

Studio Platform (Code Agents)

- Architected and executed the foundational Code Agents UI platform from concept to launch — delivering intuitive navigation, agent discovery, usage telemetry, threat detection, command analytics, and enterprise onboarding for AI code agents (Cursor, Claude Code).
- Standardized platform-wide threat definition across product, design, and engineering, establishing unified security metrics and resolving cross-functional ambiguities.
- Engineered a modular, reusable telemetry module decoupled into core APIs and visual modules, accelerating future observability feature rollouts across the enterprise platform.
- Integrated PostHog analytics and configured dashboards to track key user interactions; traced a client-side event-tracking gap to ad blockers and resolved it by routing requests through a Next.js reverse proxy.
- Used PostHog data to diagnose and fix a signup-friction issue caused by an under-visible Terms & Conditions checkbox, recovering lost signup completions.
- Led a zero-downtime data-layer migration across Code Agents pages as legacy APIs were deprecated, rewriting hooks and validating correctness to keep the product live throughout.
- Contributed backend fixes across repos — API endpoints, data aggregation — to unblock delivery rather than wait on backend availability.
- Self-initiated UI/UX consistency reviews across Studio modules, standardising severity colors, chart styles, policy UX, page titles, and terminology.
- Led a full mobile responsiveness pass across the platform, making it usable on mobile.

Legacy LLM Gateway — Stabilisation & Improvements

- Owned the Provider-Route consolidation — merging two disconnected UIs into a single navigation flow instead of patching them independently — resolving the gateway's main usability issue.
- Fixed critical UX and auth-flow issues — developer redirects, broken admin invites, default policy misconfigurations, and stale side-panel data — on a security product where correctness directly affects trust.
- Maintained the Playwright E2E suite across pages, stabilizing CI and keeping deployments safe.

Uber — Databook: Internal Data Insights Platform (Client)

Jan 2022 – Jun 2025 · React, TypeScript, GraphQL, Apollo Client, Base Web UI, Jest, Playwright

- Led the end-to-end migration of Databook's analytics tracking from Universal Analytics (UA) to GA4 — remapping UA's category/action/label event model to GA4's event/parameter schema, replicating view-based segmentation with GA4 data filters, and authoring the team's reference documentation for the new setup.
- Reduced landing-page load time from ~12s to under 3s (a 75% improvement) through API optimization and efficient data handling, serving 1,000+ internal engineers.
- Designed and built a recursive nested tree view for deep input-field hierarchies, balancing usability against complex state management and rendering performance.
- Built chat personalization features — ownership tracking, mentions, bookmarks, filtering, sorting — working through the workflow end-to-end before connecting to GraphQL APIs.
- Migrated two legacy analytics views into more maintainable, well-structured interfaces.
- Wrote unit tests with Jest, increasing coverage and setting testing standards for the module.

Coolpanda — Website Revamp (Client)

2022 – 2023 · React, TypeScript, Lottie Animations, Render

- Served as primary client contact, owning the project end-to-end while coordinating with designers, a junior developer, and a content creator.
- Gathered requirements directly, translated them into clear tasks, and defined navigation flows and content structure to bridge client goals with technical execution.
- Built the site in React with custom Lottie animations designed specifically for the client to deliver a polished, interactive experience.
- Handled deployment end-to-end — deployed to Render, configured DNS, and managed client updates throughout.

Stealth Startup — System Architecture Visualisation Tool (Client)

Jun 2021 – 2022 · React, TypeScript, ReactFlow

- Sole frontend engineer on an early-stage, graph-based platform for visualising system architecture, built with ReactFlow.
- Designed a client-side visual diff system comparing JSON graph structures — highlighting added, deleted, modified, and unchanged nodes — so teams could review architecture changes before committing.
- Built persistent state via localStorage to preserve graph state across sessions, and delivered sequence execution tools to simulate cross-component interactions.

Internal Contributions at Deuex Solutions

- Conduct frontend technical interviews, evaluating candidates on JavaScript and React fundamentals.

Zeus Learning Pvt Ltd

Software Developer · Mumbai · Jan 2016 – Aug 2018 · C#, JavaScript

- Built interactive simulation platforms replicating Microsoft Office desktop workflows (Excel, Word) for enterprise clients.
- Promoted from intern to full-time developer, taking ownership of multiple modules delivered to enterprise clients.

EDUCATION

B.Tech in Computer Engineering

Dharmsinh Desai University · 2012 – 2016
